

Product Manager - Mahjong Case Study

The Context

You are the **Product Manager for Mahjong**. You are the architect of the mahjong player's experience and the guardian of the vertical's place in the ecosystem.

CoinPoker is the second-largest online poker room in the world. To take the Coin ecosystem beyond poker, we acquired a mahjong platform and rebranded it end to end — the logo, the colours, the name — and CoinMahjong is live. It is a peer-to-peer mahjong platform: riichi mahjong played for real money, at cash tables and in tournaments, by real players betting against each other — the house takes a fee, never the other side of the bet. Like poker, it is a people's game. The opponent is a person, the table is a room, and the skill is real.

Today the integration is skin-deep: almost none of the platform's features have crossed over, and a CoinPoker player sitting down at a CoinMahjong table would not recognise the place. Because of this the first features we want to integrate are:

1. **Profile icons:** The avatars and rings players already own on CoinPoker, carried to the mahjong table — same identity, same standing. So that users recognize the platform at the Mahjong table
2. **Emotes:** The in-game reactions players throw at each other, adapted to a mahjong table's shape, seat count and pace.
3. **In-game chat:** CoinPoker's table chat, living inside the mahjong game — open, scroll, send, without touching the flow of the hand.

A working implementation means something **clickable and interactive**. How you obtain assets, behaviours and conventions is part of the exercise: the client is publicly downloadable, the tables are open at play-money stakes, and there is plenty of promotional content online. You are free to leverage any tools — AI agents,

decompilers, screen recordings — provided the result is real. You should question whether the same exact style should be maintained.

1.2 Decision Log

Keep a log of the critical product and business decisions you make along the way — what you chose, what you rejected, and the reasoning behind both.

1.3 What comes next:

Assuming the feature is a success, what would be the next steps? Which system would you add and/or modify — and would you also recommend it to the CoinPoker team? Write a small summary of the new system, the value it would bring, and whether CoinPoker should implement it and why.

Deliverables

- The prototype, delivered as files or a live website.
- A document with your decision log (1.2) and the description of the new feature you would build next (1.3).

Constraints

- Time: approximately one week.
- Get ready to explain your decisions at the next interview.
