

Below is a close adaptation of the existing Shield and Insights JDs, preserving their structure, tone, and level of detail.

Senior Product Manager – Mahjong

About Block Labs

Block Labs is a premier technology studio operating at the bleeding edge of Web3, Artificial Intelligence, and iGaming. We don't just ship features; we engineer high-scale, production-grade platforms that power the next generation of digital products.

We are a collective of senior engineers, product strategists, and builders who refuse to compromise on architecture. Whether we are designing autonomous multi-agent AI systems, building decentralised financial infrastructure, or architecting high-frequency iGaming platforms, our standard is excellence.

We move fast, but we build for the long term. If you are looking to work alongside a team that values deep technical expertise, thoughtful system design, and product ownership, Block Labs is where you belong.

About the Role

We are hiring a senior, strategically minded Product Manager to act as a mini-business owner, with end-to-end ownership of Mahjong — a consumer-facing gaming product that has recently launched its MVP.

The product was acquired and has since undergone significant backend redevelopment alongside a quick frontend refresh. The next phase is to take it from a functional MVP into a stable, differentiated, and commercially successful product.

You will own the Mahjong experience across registration, onboarding, gameplay, game modes, rulesets, settings, player-facing features, and the wider post-launch roadmap. This includes monitoring performance, identifying where the product is underperforming, launching new Mahjong variants, improving the core experience, and deciding what should be built next.

This role requires genuine product ownership. You will not be given a fixed roadmap to administer or wait for leadership to tell you what to do. You are expected to challenge, reorder, remove, and add roadmap items based on evidence, then bring clear recommendations to the Product Lead and CXO for alignment and approval.

Mahjong includes integrations with a wider casino platform and cashier experience. Those underlying products are owned by separate Product Managers. You will work closely with them and will be responsible for ensuring that the integrations work effectively within

Mahjong, but you will not own the casino, sportsbook, cashier, or their underlying commercial roadmaps.

This is also an AI-native Product Management role. We are moving towards a PM-led development model built around Claude Code and agentic workflows. The Product Manager sits at the centre of research, product definition, prototyping, ticketing, testing, and implementation.

You will be supported by dedicated design and engineering resources. Design will establish the design system and add visual polish, while engineering will lead backend development and provide technical oversight. This is not, however, a traditional specification-and-handoff role. You are expected to use AI agents to move work forward directly and turn product ideas into something tangible.

The role reports to the Product Lead, with a dotted line to the CXO.

What You'll Own

- **Full product lifecycle of Mahjong**, owning vision, roadmap, discovery, prioritisation, requirements, delivery, launch, and iteration.
- **Mahjong performance**, with particular accountability for registration conversion, speed and quality of roadmap delivery, and conversion from Mahjong into the casino experience.
- **Player engagement and product health**, including retention, repeat play, games per user, game completion, gameplay stability, funnel performance, and the effectiveness of new game modes and rulesets.
- **The Mahjong player experience**, including registration, onboarding, lobby and table experiences, game discovery, gameplay flows, rulesets, settings, player-facing features, and relevant integrations with casino and cashier products.
- **The post-MVP roadmap**, using product data, player behaviour, operational insight, and commercial priorities to challenge existing assumptions and determine what should be built, changed, delayed, or removed.
- **The AI-native product development workflow**, coordinating agents, design, engineering, and shared QA resources to move effectively from research and requirements through to prototyping, implementation, testing, and release.

What You'll Be Doing

This is a hands-on role. You will:

- Monitor registration, onboarding, gameplay, engagement, stability, and casino-conversion metrics to understand where the product is succeeding and where intervention is required.
- Define and continuously refine the Mahjong roadmap, balancing immediate post-launch improvements with new game modes, additional rulesets, growth features, technical dependencies, and longer-term product differentiation.

- Use AI tools such as Claude Code, AI Studio, v0, Cursor, or similar tools to conduct research, explore product concepts, write PRDs, produce tickets, create implementation plans, build prototypes, and contribute directly to frontend development.
- Manage agents across the product development lifecycle, providing clear context, constraints, acceptance criteria, and feedback rather than treating AI as a basic chat or writing assistant.
- Define and maintain product artefacts covering problem statements, player journeys, gameplay flows, success metrics, analytics requirements, constraints, assumptions, trade-offs, and decisions.
- Translate player, commercial, operational, and gameplay requirements into clear requirements that can be acted on by design, engineering, and AI development agents.
- Work closely with the dedicated designer to establish a consistent design system and turn functional experiences into clear, polished, and enjoyable player journeys.
- Work closely with engineering on backend requirements, integrations, technical constraints, implementation decisions, and the validation of agent-produced development work.
- Lead product testing and acceptance, using agents for a significant proportion of QA while conducting hands-on product testing and bringing in shared QA support where appropriate.
- Own analytics requirements and instrumentation, ensuring the product has the tracking needed to understand registration conversion, player behaviour, gameplay performance, stability, retention, and movement into casino.
- Prioritise defects and incidents within the product roadmap, taking technical recommendations from engineering while retaining product accountability for prioritisation, except where an incident requires immediate intervention.
- Partner closely with the Casino Product Manager and casino operations team to improve how Mahjong players discover and move into the casino experience, without taking ownership of the underlying casino product.
- Partner closely with the Cashier Product Manager to ensure deposits, withdrawals, balances, and related payment journeys work effectively within the Mahjong experience.
- Engage stakeholders with clarity and intent, gathering input while retaining ownership of prioritisation and trade-offs.
- Bring leadership clear, evidence-based recommendations for approval rather than waiting for detailed direction or relying on stakeholders to define the roadmap.

Experience We're Looking For

We don't expect a unicorn — but we do expect strong product sense, a high level of autonomy, and a genuinely AI-native way of working.

Required

- 5+ years in a Product Management role.

- Demonstrated experience owning a consumer-facing digital product across discovery, roadmap, requirements, delivery, launch, measurement, and iteration.
- Heavy day-to-day use of AI within your current role, ideally extending beyond conversational tools into prototyping, research workflows, product documentation, ticket creation, development, testing, or agent management.
- Hands-on experience with tools such as Claude Code, Cursor, AI Studio, v0, or similar, or clear evidence that you have built sophisticated working practices around comparable AI tools.
- Strong understanding of Product Management fundamentals, including discovery, requirements definition, prioritisation, delivery, stakeholder management, experimentation, and iteration.
- Strong product judgement and a track record of independently identifying problems, forming recommendations, and driving action without requiring constant direction.
- Experience using funnel, engagement, retention, conversion, and product-quality metrics to make clear roadmap and prioritisation decisions.
- Experience working on products with meaningful backend logic, integrations, technical dependencies, or transactional user journeys.
- Strong delivery skills, with the ability to balance product quality, commercial outcomes, technical constraints, and speed of execution.
- Comfort being at the centre of a cross-functional development process, coordinating dedicated design and engineering resources while remaining directly involved in producing and validating work.
- Ability to operate autonomously while following agreed product, design, engineering, and approval processes.
- A genuine interest in Mahjong and a willingness to learn the game, its rules, its player behaviours, and its variants deeply and quickly.

Useful

- Strong existing knowledge of Mahjong in any established ruleset or regional variant.
- iGaming, casino, social gaming, multiplayer gaming, or real-money gaming experience.
- Experience owning products involving lobbies, tables, matchmaking, game sessions, gameplay state, or multiple game modes and rulesets.
- Experience improving registration funnels, onboarding, repeat engagement, retention, or cross-product conversion.
- Experience taking ownership of an acquired, inherited, or underperforming product and moving it from initial launch into a more stable and differentiated proposition.
- Experience working across products owned by multiple teams, where you are accountable for the quality of an integration but do not own the underlying platform.
- Experience in fast-moving environments where the Product Manager is expected to prototype, test, and move ideas forward directly rather than relying on a traditional handoff process.
- Practical experience orchestrating multiple AI agents across research, requirements, prototyping, ticketing, development, and QA workflows.
